but drug use in adolescence, especially early adolescence (age 13 or 14), can damage the brain and increase the risk of addiction and other problems later in life.

it was found that, of the 36 chemotherapeutic agents used to treat these patients, only 22 were FDA-approved for use in breast cancer.

doctors had high hopes for this class of drugs for their patients who needed long-term pain relief.

from the national institute on drug abuse, which would enable us to actually do an intervention on campus,
